

2026 Post-ICML Workshop

❑ Introduction

The 2026 ICML (International Conference on Machine Learning) conference, a leading top AI academic conference, will be held in Seoul during July 6-11. This workshop aims to invite researchers from the conference attendees to share their latest research findings and trends, centering on AI safety, security of mobile on-device AI, data-centric graph learning, and multimodal AI. Additionally, some speakers will cover more on the behind-the-story of papers: motivation and impetus for a paper's initiation, the process of problem formulation and corresponding idea generation, challenges and responses during the process, the review and rebuttal process, the utilization of collaboration network, hard-learned lessons, etc. Early career researchers including post-graduate students and post-doctoral fellows can learn best practices in research methodologies, collaboration networking and career management.

❑ Overview

- o Date: July 10th (Friday), 2026
- o Venue: Gachon University, AI Hall, Room 100
(<https://maps.app.goo.gl/fnUXTbBcbcuPwa3Z6>)

❑ Schedule

Time (KST)	Title	Speaker
10:00 – 10:50	Building Digital Trust: Decentralized Identity and AI Safety in the Digital Era	Prof. Lam Kwok Yan
11:00 – 11:50	The Security Landscape of Mobile On-device AI: From Local Models to Real-World Threats	Dr. Yujin Hwang
12:30 – 13:20	Lunch Break (A light lunch will be provided by the organizer.)	
13:20 – 14:10	Automated Graph Machine Learning: Toward a Data-centric Framework	Prof. Xin Zheng
14:20 – 15:10	Recent Trends in Multimodal AI at ICML 2026	Linta Iqbal

15:20 – 15:30	Q&A and Closing	Prof. Seong Oun Hwang
---------------	-----------------	-----------------------

□ Abstract

Speaker	Abstract
Prof. Lam Kwok Yan (Vice President, Nanyang Technological University, Singapore)	This talk explores how digital trust can be built in the digital era through two foundational pillars: decentralized identity and AI safety. The talk discusses that decentralized identity and rigorous AI safety testing together form a critical foundation for secure, privacy-preserving, and accountable digital ecosystems.
Dr. Yujin Hwang (Post-doctoral Fellow, University of Melbourne, Australia)	Mobile on-device AI (MoAI) systems that integrate locally deployed AI models with conventional mobile software components are emerging as a key paradigm for delivering intelligent functionality directly on end-user devices. By moving inference from remote cloud services to the local mobile environment, such systems enable privacy-preserving, low-latency, and offline-capable AI functionality, yet introduce new security risks arising from the local storage of AI models. This paper presents the first comprehensive systematization of knowledge on MoAI security, covering security pillars, attack landscape, and defense landscape of MoAI systems. We further identify unresolved gaps in current attack and defense research and point to promising directions for future research in this emerging area. Our work establishes the first systematic framework for understanding the attack and defense landscapes of MoAI systems, serving as a foundation for building secure MoAI systems and advancing research in this critical domain.
Prof. Xin Zheng (RMIT University, Australia)	Automated graph machine learning is emerging as a powerful paradigm for building efficient and deployable models across a wide range of real-world applications, from scientific discovery to recommender systems. In this talk, Dr. Xin Zheng presents a data-centric perspective on automated graph learning, focusing on the full pipeline—from graph data-level scalability to graph model-level deployment. The talk introduces a structured framework that addresses three key dimensions (1) Scalability, through data-driven graph condensation techniques (2) Automation, via neural architecture search guided by graph properties and learning tasks; and (3) Deployability, through test-time evaluation and adaptation mechanisms for practical model deployment. The presentation offers a unified perspective on efficient and deployable automated and data-centric graph learning.
Lintal Iqbal (Post-graduate Researcher, Gachon University, Korea)	This presentation will offer a preview of the key trends in multimodal AI expected to emerge from ICML 2026, based on the conference's accepted papers, invited talks, and workshop themes. The focus will be on identifying shifts towards current AI practices. Particular attention will be given to how multimodal systems are evolving to handle more complex tasks and real-world interactions. Finally, key takeaways and their potential implications for our ongoing work will be discussed.
